

Voyager - Network & Application Discovery

ICT Services

Benefits

- Legal Compliance
- Increased Automation
- Up To Date Technology
- Increased ROI
- Improved Performance
- Reduced Security Risks

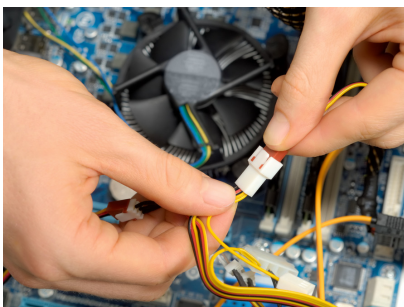

“Seeking real opportunity from your IT Assets”

Network Discovery is the process that utilises industry leading discovery tools to enable aap³ to connect and discover the devices that make up the network. Hardware and network infrastructure technology is constantly improving and therefore needs upgrading. The need to regularly audit the IT estate ensures licenses are current, connected devices are not end of life and any security issues can be addressed.

From our network discovery we produce an inventory of each device. The inventory details the device Hostname, its Product Number, the Serial Number and Product Type. In certain circumstances the report may also include Product (e.g. Cisco) End-of-Sale/Support information and physical location details.

72% of all discovered products on networks are either end-of-life or end-of-sale and can be seen as targets for upgrade. This information not only gives you significant targeted sales opportunities but also gives you the insight to have deeper, more relevant conversations with your customer.

aap³ is an established Cisco partner working within their installed partner networks. Our team is highly experienced in the end to end process, producing full analysis and recommendations.

Benefits

- Fast and low-impact deployment through unique agentless technology.
- Guaranteed visibility into all application interactions across both physical and virtual machines via network-based approach.
- Discovery of unknown, unwanted and unexpected application behaviours.
- Monitor your on-going compliance trend by application and vendor.
- Monitor the effectiveness of Software Asset Management policy and procedures.

Application Discovery

Application Discovery is the process of automatically analysing components of software products and determining the structures and tools associated with it. In doing so, it ensures future compliance, controls costs and resolves issues, such as unsupported programs and security – it also monitors software deployments, upgrades and removal of software assets, and helps align asset management processes as your business grows.

Application Discovery allows you to quickly and accurately map your application dependencies to accelerate data centre moves, precisely plan infrastructure consolidations and confidently virtualise your business critical applications.

Investing in the technology to discover the software in your environment, will ensure you are able to reconcile usage with contracts and licences. This can prevent exposure to vendor audits whilst providing the opportunity to reduce cost through the better management and recycling of surplus software licences.

aap³ application discovery provides the automated, real-time application discovery and dependency mapping capability you need for effective, dependency-driven change, configuration, incident and problem management across physical and virtual environments.

A major advantage to using **aap³** Network & Application Discovery Services is our **fully integrated solutions offerings**. Our range of Products and Services can be used standalone or combined to generate the most effective solution package to meet the most challenging ICT, Business Applications and Recruitment demands.

At **aap³** we believe a strong understanding and review of the problem/challenge is paramount before diving into a technology solution. By expertly consulting our clients, we provide a tailored solution that fully matches their needs, ensuring a real return on their investment.

The power to have an ICT vendor deliver, install and support a full end-to-end outsourcing solution and provide a flexible engineering resource can be a key tool for business improvement and allows you to focus on your core business critical tasks whilst we deliver your context tasks.
